Tomographic n(z): existing MLP vs. best compatible Qwen

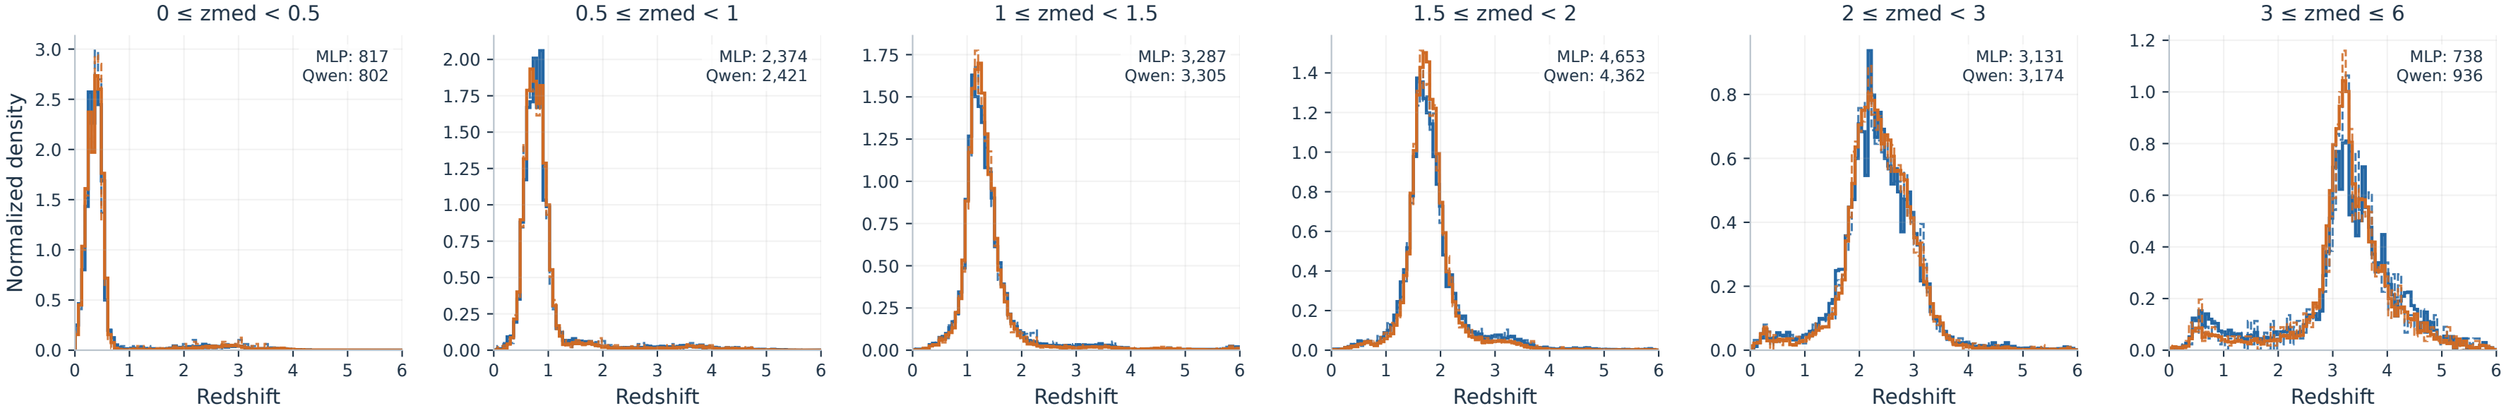

Galaxies assigned to bins using each model's predicted PDF median; reference and stacked PDF use the same selected galaxies.

MLP: stacked PDF — MLP: reference histogram — Qwen: stacked PDF — Qwen: reference histogram

HSC–DESI · 5,683 validation galaxies · DESI spec-z reference

CLAUDS · 15,000 validation galaxies · catalogue ZPHOT reference

Within each bin:

Each model has its own bin membership.

Solid and dashed curves share those exact objects.

Curves are normalized separately within each model/bin. Stacked PDFs are exact sums of saved probabilities; no Monte Carlo sampling or smoothing.

Validation/model-selection diagnostics; training budgets differ. HSC curves are shown at 0–2 without renormalizing the zoom (full PDF support: 0–4.5).
